Re; rubber removal Gold Coast Airport Runway 14/32 December 5th 2006:

Dear Wayne,

We engaged the services of Multitech highways & Runways P/L to remove the rubber and improve the Co-efficient of friction of our main runway 14/32.

There Ride on captive Shot blasting machine the Blastrac DH 4800 machine preformed the task to our expectations both in cost and performance.

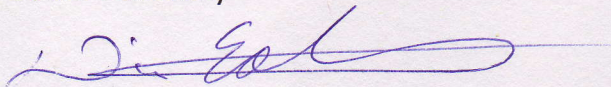

The 9000m² was completed in two nights, in blocks of approx 7 hours each night ,proving to be much faster and more efficient than the previous methods we have used in the past (high pressure Water).

Both the Macro texture and the Micro texture were significantly improved, the speed in which the machine worked and the on board dust collection system which contains all the dust and debris was most impressive.

The job is finished as soon as the machine has passed over it, and there was no problem with water Bourne pollutants.

In closing I would like to say that Multitech Highways & Runways completed the woks in a very professional and efficient manner, I would have no hesitation in engaging them to return and remove the rubber next time it falls due

Yours Faithfully

D. Eatock
Operations & Security Manager
